

Treatment of High Grade Non-Muscle Invasive Urothelial Carcinoma of the Bladder by Standard Number and Dose of Intravesical BCG Instillations versus Reduced Number of Intravesical Instillations with Standard Dose of BCG. A European Association of Urology Research Foundation Randomized Phase III Clinical Trial. Protocol Number: EAU-RF 2008-01. Eudract Number: 2010-019181-91

Timelines

The study includes a 6-year recruitment phase, followed by a 3-year observation phase. Germany started recruitment in December 2013, The Netherlands were initiated in October 2014. France started recruitment in July 2017. Belgium and Spain are expected to start mid 2018.

Possibilities to start up in other countries like Turkey, Portugal and Italy are currently being evaluated.

Study Objectives

- ◆ **Primary Endpoint:**
Time to first recurrence [Reduced Number of BCG Instillations not inferior to Standard Number intravesical BCG treatment].
- ◆ **Secondary Endpoints:**
 - Number and Grade of Recurrent Tumors
 - Rate of Disease Progression to a higher stage (T2 or higher)
 - Incidence and Severity of Side Effects.

In Brief

Intravesical instillation of BCG is a widely accepted strategy to prevent recurrence of non-muscle invasive bladder cancer. The most accepted treatment schedule is induction of BCG: weeks 1 through 6 plus maintenance (weeks 1, 2, 3) at months 3, 6 and 12, but it is unknown how many administrations are really necessary. Scientific evidence supports the hypothesis that after an initial sensitization to BCG antigens has occurred, the number of instillations can be reduced for a proper anamnestic immune response resulting in similar clinical efficacy and potentially less side-effects and costs.

The NIMBUS is a multicenter prospective, randomized, parallel group, not blinded trial to compare the efficacy and safety of two different Adjuvant treatment schedules randomized into two groups:

Group 1: Standard Frequency

Induction cycle BCG-full dose; weeks 1 through 6 plus maintenance cycles at months 3, 6 and 12 (weeks 1, 2, 3); total 15 full dose BCG instillations

Group 2: Reduced Frequency

Induction cycle BCG-full dose; weeks 1, 2, and 6 plus maintenance cycles at months 3, 6 and 12 (weeks 1, 3); total 9 full dose BCG instillations.

Please find the full description of the trial on the [Nederlands Trial Register](#).

Study Design

Study status (cut-off date 1 March 2018)

Twenty-eight centres are open for recruitment in Germany of which 26 sites randomized, in total, 123 patients. In the Netherlands, 13 centres are initiated of which 12 sites recruited, in total, 77 patients. France started recruitment in July 2017; 3 of 5 initiated centres randomized, in total, 23 patients.

Randomization status GERMANY (cut-off date 1 March 2018)
